

izCAST Whole-Home-Radio

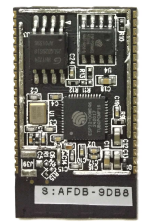

Overview

Internet radio brings hiss-free radio broadcast from across the globe. Tens of thousands of free-to-listen radio stations are broadcasting all kinds of music and talks programs to people with Internet access and a streaming player.

The limited Wi-Fi range and the need to control audio volume to avoid disturbance to the neighbours prevents radio lovers from enjoying radio as they move around their homes. izCAST from ALD solves this problem by re-broadcasting the audio program from the Internet-connected Master radio to properly placed slave radios and synchronizing the playback to provide the Whole-Home-Radio listening experience. Moreover, slave radios can also stream-play BT music from smart phones and PCs.
